# SCAN is easy to install, simple to operate, and proven dependable

## Choice of Transmitters

Easy to operate, unobtrusive, and dependable best describes the SCAN transmitters designed especially for use in and around the court environment.

Our black "pen" transmitter contains no electronics and no batteries. It may be worn inconspicuously with street apparel or on the robe while at the bench.

For added safety while transporting prisoners, as well as within the courtroom, our electronic Model LC-210 provides continuous, multi-directional signaling. Should a situation arise wherein an officer is unable to activate his transmitter, having been overcome, unconscious, or "pinned down," the LC-210's "man-down" feature will automatically signal for help. The LC-210 has been designed to mount securely on a standard uniform duty belt and, when worn properly, it will also activate upon forced removal.

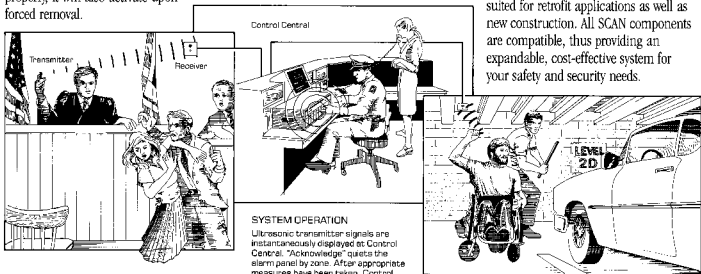

## Control Panels with Simple ON/OFF Switching and Features for Any Application

SCAN is a three phase system: transmitter to receiver to control center. A single control center can monitor, by zone, selected areas throughout your court facility or entire justice center.

Receiver units are strategically positioned throughout a facility. Upon activation of any SCAN transmitter, an audible as well as visual signal is initiated at the control center pinpointing the location of

the incident. As an added feature, audio threshold alarm can be added in areas such as conference rooms. If confronted with a potentially violent situation, Counsel, not normally provided with a transmitter, can summon help by simply yelling above normal noise levels.

There is virtually no limit to the number of locations or zones that can be monitored. SCAN receivers are ideally suited for retrofit applications as well as new construction. All SCAN components are compatible, thus providing an expandable, cost-effective system for your safety and security needs.

### SYSTEM OPERATION

Ultrasonic transmitter signals are instantaneously displayed at Control Central. "Acknowledge" quiets the alarm panel by zone. After appropriate measures have been taken, Control Central is notified and the zone is then "Reset."
